

Want label to go around cup by proportionally same amount.

r is radius at label center.

θ is slope angle in radians so

$$\theta = \frac{\text{degrees}}{180} \times \pi$$

where $\pi = 3.14159 \dots$

$d = 2\pi r$ diameter so to find ratio by where bottom label edge shrinks

$$\frac{d_r}{d_m} = \frac{2\pi(r-b)}{2\pi r} = \frac{r-b}{r}$$

where $b = \frac{h}{2} \tan(\theta)$ by trig

so bottom edge of distorted label is

$$w_b = w \times \frac{r - \frac{h}{2} \tan(\theta)}{r}$$

Find length of box before distortion

$$w_b = R\phi$$

$$w = \left(R + \frac{h}{2}\right)\phi$$

$$w = \left(\frac{w_b}{\phi} + \frac{h}{2}\right)\phi$$

$$w = w_b + \frac{h\phi}{2}$$

$$w - w_b = \frac{h\phi}{2}$$

$$\boxed{2 \frac{w - w_b}{h} = \phi}$$

$$w = \left(R + \frac{h}{2}\right) \frac{w_b}{R}$$

$$wR = w_bR + \frac{w_b h}{2}$$

$$wR - w_bR = \frac{h w_b}{2}$$

$$\boxed{R = \frac{h w_b}{2(w - w_b)}}$$

$$\frac{l}{2} = \sin\left(\frac{\phi}{2}\right) R$$

$$\boxed{l = \frac{h w_b}{w - w_b} \sin\left(\frac{w - w_b}{h}\right)}$$

The length of the label before distortion is applied should be l .

Guessing that 'Bend' % is $\frac{\phi}{2}$?

$$\frac{\phi}{2} = \frac{w - w_b}{h} \quad \left(0, \frac{\pi}{2}\right) \quad \pi = 3.14159 \dots$$

So

$$\text{Bend \%} = 2 \times \frac{w - w_b}{h \times \pi} \times 100$$
